CARBONSYNC · DEMO REPORT

Final report

Observation coverage: 1/10 days · 1 images

Evidence boundary

Personal names and residential addresses are excluded from this report.
Parking images provide vehicle snapshots only. Commute emissions below are estimates from user-provided student activity and provisional factors. Coverage is 1 of 10 campaign days.

Parking observations

DATE	INFERENCE STATUS	SAVED CLASS COUNTS	EVIDENCE	IMAGE SHA-256 PRI
2026-10-16	completed_with_detections	bicycle 0 · car 9 · motorcycle 1 · bus 0 · truck 0	Human-corrected	c688c92b5181424

Original image files are not retained by the backend; the analysis ID and image fingerprint provide provenance for each saved result.

Student commute estimate

5	7.73 kg	77.34 kg
Records	Average weekday estimate	10-day estimate

weekly commute vehicle-km = one-way km × 2 × commute days/week; annual activity = weekly activity × 52; shared/passenger vehicle-km is divided by the entered occupancy; weekday average = weekly emissions ÷ 5.

MODE	STUDENTS	ESTIMATED EMISSIONS
motorcycle	1	546.00 kg/year
car	4	1464.91 kg/year

Car, motorcycle, and bus factors are existing demo candidates and are not verified or approved sources. Fuel-specific applicability is not validated; electric records are omitted until a grid factor is configured. Distance is manually supplied; no address geocoding or routing is performed. Observation-period emissions are student-commute estimates, not emissions measured by parking photos.

Saved scenario comparison

Deterministic calculations from scenario inputs; this is not a forecast. A negative change means emissions increase.

SCENARIO	ANNUAL KG CO_2	REDUCTION (+) / INCREASE (−) VS BASELINE KG
No scenario comparison saved.		

Recommendations

Rule-based recommendations (LLM unavailable)

Recommendations are based on the saved aggregate demo data; no emissions savings are calculated here.

PRIORITY 1

Extend parking observations across additional campaign days

The campaign currently contains 1 observed days; more sessions can clarify day-to-day variation.

Assumptions: Each uploaded image is one point-in-time snapshot; same-day images are kept separate.

Constraints: Do not interpret a parking snapshot as daily trips or unique commuters.

Not calculated from current data

PRIORITY 2

Review commute options for the most represented travel group

car is currently the most represented saved commute mode.

Assumptions: Student records and distances are user provided.

Constraints: Validate routes, access, capacity, and costs before selecting an intervention.

Not calculated from current data

Emission-factor register

CATEGORY	VALUE	UNIT	APPROVAL STATUS
car	0.145	kg CO2/veh-km	illustrative_unapproved
motorcycle	0.035	kg CO2/veh-km	illustrative_unapproved
bus	0.85	kg CO2/veh-km	illustrative_unapproved
walking	0	kg tailpipe CO2/passenger-km	zero_tailpipe_scope
cycling	0	kg tailpipe CO2/passenger-km	zero_tailpipe_scope

Sources, geographic applicability, fuel coverage, and independent validation are not available for the existing candidates. Do not present these values as verified factors.

Method and limitations

Commute annual vehicle-kilometres are estimated as one-way distance × two legs × commute days per week × 52. Shared vehicle activity is allocated by entered occupancy. Emissions are vehicle-kilometres × the current category factor. Factors are demo candidates and are not verified or approved; electric commute records are not calculated without a configured grid factor. Addresses are not geocoded. Parking counts are not converted into trips or emissions.

Multiple images on the same date remain separate snapshots. Dashboard trends average same-day image counts rather than adding them. Inference accuracy on overhead parking images has not been established with a labeled evaluation set.
